

Selected prototype: dynamic decision examination

SELECTED DIRECTION

A normal AI agent proposes the decision. FactHarbor examines its evidence. A separate gate decides release.

WHAT IS PRESET AND WHAT IS DYNAMIC

PRESET FOR THE PROTOTYPE

Simple release rule; permitted data and disclosure boundaries; recipient and release contract; controlled German/English test requests; stop reasons; receipt schema.

DYNAMIC FOR EACH ATTEMPT

Free request; exact agent decision; permitted relevant context; one new FactHarbor analysis; supporting and opposing evidence; limitations and uncertainty; release or stop outcome.

BOUNDARY The prototype releases a checked decision. It does not execute or authorize a resulting action. Controlled tests avoid multiple independent decision and effect paths.

Later EGA: repeat control at every effect boundary

LATER DEVELOPMENT

A released decision does not itself authorize a message, tool call, filing, payment or system change.

PROTOTYPE NOW

ONE CONTROLLED DECISION RELEASE
Free request; one exact decision; dynamic FactHarbor examination; simple release-or-stop rule; exact Commit binding; receipt for release and stop. Resulting actions remain outside scope.

LATER PRODUCT WORK

MULTIPLE DECISIONS AND EFFECTS
Organisational identity and delegation; private permitted evidence; fresh control at agent and tool hand-offs; effect-specific authorization; lifecycle, recovery, challenge and accountable remedy.

KNOWN LIMIT FactHarbor's model-assisted decomposition can miss a consequential decision component. The prototype evaluates and reports this; it does not claim complete semantic coverage.
